Abstract:- Research on the hypothetical analysis of the causes of traffic congestion in Umuahia metropolis was carried with a view to identify the perpetual causes of traffic congestion most during peak periods and consequently analyse their effects in their various degrees using the T-test. Traffic congestion in Umuahia, the capital city of Abia State, Nigeria has been frustrating and seeking for lasting solutions to this obvious problem was the main objective of this research work. In the process of the present research work, 48 causes of traffic congestion were identified and analyzed statistically from the understandings of "ROAD users" and "FRSC officers" who are major players in the studied environment through a means of responses to a set of questionnaires and severity index rankings. This lead to the establishment of an agreement based on the analyzed causes by both parties through the process of null hypothesis. And by agreement fully represented in the tables and null hypothesis, the ROAD users and FRSC officers collectively highlighted several factors as the most severe causes of traffic congestion in Umuahia; "Wrong parking on traffic pavement" that was ranked 1st and 2nd by ROAD users and FRSC officers with Is of 95.833% and 92.453% respectively. "Impatience and intolerance amongst drivers" that was ranked 1st and 4th by FRSC officers and ROAD users with Is of 93.711% and 90.104% respectively. "Construction of one lane instead of two" that was ranked 2nd and 3rd by ROAD users and FRSC officers with index of 91.667% and 91.195% respectively. "Poor road network" that was ranked 3rd by ROAD users with index of 91.146%. "High uneducated and unlicensed drivers" that was ranked 4th by FRSC officers with index of 90.567%. "Dilapidated roads and potholes" that was ranked 5th by ROAD users with index of 89.063%. "Small width of roadway" that was ranked 5th by FRSC officers with index of 89.937%. Consequently, this result will guide FRSC officers, ROAD USERS and GOVERNMENT in taking steps and making policies to reduce the traffic congestion in Umuahia metropolis.

Keywords: *Hypothetical analysis, traffic congestion, Umuahia metropolis, T-test.*

1. INTRODUCTION

Urban traffic congestion and transport problem remains one of the nagging problems in urban transportation today. Urbanization according to (Osuji et al, 2009) noted myriad challenges to transportation system in relation to negative extremity such as traffic congestion and environmental risk. However the fact that cars have brought freedom and mobility to many people cannot be overlooked; but there is increasing concern about the health and environmental pollution through the smoke of the steaming vehicle in traffic congestion scene. The emergence of traffic and subsequently traffic congestion has opened up the need for improved traffic flow to ensure reduced travel time, safety and average fuel consumption and healthy environments (Ogwude, 2011). Road traffic congestion can be described as a physical observable fact relating to the manner in which vehicles hinder one another's progression and demand for limited road space approaches full capacity. Traffic congestion occurs when impatient drivers don't allow themselves to manoeuvre each other in a limited capacity road (Awosusi and Akindutire, 2010). The process of traffic congestion is also known as traffic jam or gridlock. Gridlock is a term used in describing the inability to move on a transport network. The study was aimed at identifying the factors which are responsible for traffic problems in Umuahia city, analyze these causes and come up with a clue on how the problem could be solved. Many other researchers have adopted different approaches in proffering solutions to problems relating to traffic congestion in different cities both in Nigeria and the developed countries of the world (Ogwude, 2011; Abbott, 2012; Momoh, 2011; Haruna, 2011; Igwe et al, 2011; Nwosu, 2014a; Oni, 2012; Osuji et al, 2013; Nwosu, 2014b; Popoola et al, 2013; Aderamo, 2010; Aderamo, 2012; Aderamo and Atomode, 2012; Awosusi and Akindutire, 2010; Uwadiegwu, 2013).

2. RESEARCH METHOD AND SAMPLING

Umuahia the capital city of Abia state in southern Nigeria is located between latitude 5° 32′ and 5.533°00′ North of the equator and longitudes 7° 29′ and 7.483°00′ East of the Greenwich meridian. It is located along the rail road that lies between Port Harcourt to Umuahia south and Enugu city to its north (Google, 2015). The data was collected by method of questionnaire shared to road users and FRSC agents and their responses collected on the degree of effect of each of the 48 factors identified as possible causes of traffic congestion in Umuahia metropolis. Each factor had respective option from I to IV, i.e. I. (Indifferent), II. (Do not Affect), III. (Mildly Affect), IV. (Strongly Affect).

Data Sampling

The Severity Index for all the identified causes of pavement failure was conducted as shown in Eq.1 (Al-Hazmi and Asaf, 1987);

Severity Index (Is) =
$$\frac{\sum_{n=l}^{n=lV} a_n x_n}{\sum_{n=lV}^{n=lV} x_n}$$
 (1)

Where a_n = constant expressing the weight given to the n^{th} responses,

a_n= I, II, III & IV for n = I, II, III & IV respectively.

a_i = I is equivalent to "Indifferent"

a_{ii} = II is equivalent to "Do not Affect"

a_{iiii} = III is equivalent to "Mildly Affect"

 a_{iv} = IV is equivalent to "Strongly Affect"

Table 1: The Responses from 64 Road Users and Survey Evaluation

While X_n is the variable expressing percentage of degree of importance of each factor,

X_I = Percentage of frequency of "Indifference"

X_{II} = Percentage of frequency of "Do Not Agree"

X_{III} = Percentage of frequency of "Mildly Agree"

X_{IV} = Percentage of frequency of "Strongly Agree"

The spearman's correlation coefficient was then carried out to ascertain the degree of agreement and deviation between the two parties under consideration for the causes of pavement failure identified with the expression in Eq. 2 (Inyama, 1995);

$$\lambda = 1 - \left[\frac{6\sum D^2}{n(n^2 - 1)}\right]$$
(2)

Where D= the difference between the rankings of each factor in both contractors and consultants,

n= the number of ranked factors.

Further, a t-test null hypothesis analysis was conducted to establish the degree of agreement between contractors and consultants on the causes of road pavement failure identified from study.

3. RESULTS AND DISCUSSION

Tables 1 and 2 represent the responses from road users and FRSC agents on the effect of the identified factors affecting traffic flow in Umuahia metropolis and the severity index (Is) and degree of ranking determine by Equation 1.

| S/N | CAUSES OF TRAFFIC CONGESTION | INDIFFERENT | DO NOT | MILDLY | STRONGLY | INDEX Is | RANK(R) |

| 48 | Lack of a roundabout at road intersection. | 1 | 1 | 21 | 30 | 83.648 | 10 |

From Table 1, it can be established that the ROAD users ranked "wrong parking on traffic pavement" 1st, "construction of one lane instead of two" 2nd, and poor road network as 3rd and from Table 2, FRSC officers in their assessment ranked "impatience and intolerance amongst drivers" 1st, "wrong parking on traffic pavement" 2nd, and "construction of one lane instead of two" 3rd. Generally, the severity indices were grouped according to respondents rating as follows:

"Strongly affect" causes: $75 < Is \le 100$ "Mildly affect" causes: $50 < Is \le 75$

"Do not affect" causes: $25 < Is \le 50$

"Indifferent" causes: $0 < Is \le 25$

Base on the ratings above, from Tables 1 and 2, ROAD users rated 37 causes as "strongly affect", 11 causes as "mildly affect", 0 cause as "do not affect" and 0 cause as "indifferent" while FRSC officers on the other hand rated 28 causes as "strongly affect", 20 causes as "mildly affect", 0 cause as "do not affect" and 0 cause as "indifferent". Table 3 shows the combined evaluation of both road users and FRSC officers on the identified factors under study.

| S/N | CAUSES OF TRAFFIC CONGESTION | ROAD | ROAD USERS | | FICERS |

| | | | | users. Some wei | - |

From Table 3, it could also be observed that both parties rated most of them as "strongly affect" but different ranking for example "wrong parking on traffic pavement" as strongly affect while their rankings were 1^{st} from ROAD users and 2^{nd} from FRSC officers respectively. "Impatience and intolerance amongst drivers" rated as strongly affect was ranked 1st by FRSC

Table 7: Computation of $\sum D^2$ and Spearman's Constant (λ)

officers and 4th by ROAD users. Some were rated as "mildly affect" while none was rated as "do not affect" and "indifferent".

Table 4 shows the deviation of responses between the two parties whose observations as they bother on the effect of the identified causes of traffic congestion are analyzed.

| S/N | CAUSES OF TRAFFIC CONGESTION | ROAD USERS | | FRSC OFFICERS | | D2 |

| 48 | Lack of a roundabout at road intersection. | 75.521 | 20 | 83.648 | 10 | 100 |
| | | | | | | ∑ <i>D</i> ² =1973 |

The spearman's rank correlation coefficient between the ROAD users and FRSC officer's was calculated using

Equation 2; ΣD²= 1973; n = 48 thus; 6x1973

$$\lambda = 1 - \left[\frac{0.893}{48(48^2 - 1)}\right] = 0.893.$$

Test of Null Hypothesis

The null hypothesis, $H_{0}\xspace$ states that ROAD USERS and FRSC OFFICERS do not agree on the severity index

ranking of the factors causing traffic congestion in Umuahia metropolis.

The t – test was used for this hypothesis.

Confidence limits = 95%

Degree of significance α = 0.05

Decision rule: if
$$-\frac{t_{\alpha}}{2} < t < \frac{t_{\alpha}}{2}$$
 (Accept H₀)

If t >
$$\frac{t_{\alpha}}{2}$$
 (reject H₀)

Using t = $\lambda [\sqrt{(n-1)}]$ where $\lambda = 0.893$ and n = 48

International Journal of Innovative Studies in Sciences and Engineering Technology

(IJISSET)

www.ijisset.org

 $t = 0.893\sqrt{(48 - 1)} = 6.122$

From t – test table, $\frac{t_{\alpha}}{2}$ = 1.94 (Inyama and Iheagwam, 1995)

Thus $t > \frac{t_{\alpha}}{2}$ (Reject H₀), (Where H₀ states that Road Users & FRSC Officers do not agree on the Severity index Ranking of the factors).

Therefore Rejecting " H_0 " Implies that both ROAD Users and FRSC Officers agree on the causes of road pavement failure in Nigeria based on the analyzed factors.

4. CONCLUSION

From the foregoing, it can be deduced as follows;

- "Wrong parking on traffic pavement" was ranked 1st and 2nd by ROAD users and FRSC officers with index of 95.833% and 92.453% respectively.
- "Impatience and intolerance amongst drivers" was ranked 1st and 4th by FRSC officers and ROAD users with index of 93.711% and 90.104% respectively.
- "Construction of one lane instead of two" was ranked 2nd and 3rd by ROAD users and FRSC officers with index of 91.667% and 91.195% respectively.
- "Poor road network" was ranked 3rd by road users with index of 91.146%.
- "High uneducated and unlicensed drivers" was ranked 4th by FRSC officers with index of 90.567%.
- Dilapidated roads and potholes" was ranked 5th by ROAD users with index of 89.063%.
- ✤ "Small width of roadway" was ranked 5th by FRSC officers with index of 89.937%. from the results as shown in the Tables 1,2,3 and 4 and the null hypothesis test conducted, there strong agreement on the views of ROAD users and FRSC officers who are mojor players in the studied area and consequently recommend that drivers must be trained and re-trained to be properly enlightened on traffic rules, commercial drivers/buses should be relocated to approved parks to ease traffic at the heart of the town and strict enforcement on defaulters, functional traffic lights should be installed at major intersections in Umuahia to avoid traffic clashes or to improve traffic control, road maintenance agency in Umuahia should work on dilapidated roads and potholes and make the road useable by vehicles, There should be provision for picking and alighting of passengers along the road, and two lanes in place of one should be constructed to enhance easy movement of vehicles.
